

What Happens if you Receive a Positive Result?

AllerFocus™ offers treatment plans that may or may not include shots. Most patients significantly improve their symptoms simply taking their Allergy Immunotherapy.

Why Immunotherapy?

Allergy Immunotherapy is the only treatment that targets the cause of allergies and alters the natural course of the disease. With immunotherapy patients may have an improved quality of life, see an end to discomfort, feeling ill, and have lower costs for symptomatic drugs.

What is Immunotherapy?

Allergies are caused by your immune system overreacting towards harmless substances the same way it would react towards something harmful like bacteria or a virus. Allergy immunotherapy, used worldwide, slowly “trains” your immune system so you may tolerate these substances upon exposure.

How does Immunotherapy Work?

Immunotherapy occurs in two distinct phases: build-up and maintenance. The build-up process begins with the administration of a weak concentration of an allergy extract which becomes increasingly stronger until you reach the maximum dose. After reaching the maximum dose you enter the “maintenance” phase. Immunotherapy is recommended for 3 - 5 years, however, length of treatment is determined by your physician.

Don't rely on medication to suppress your symptoms, talk to your doctor about finding the cause.

Do you Suffer from Allergies?

Talk to your Doctor about whether AllerFocus™ is Right for You!

Do you have Allergies?

At various times of the year, people get the typical allergy symptoms like runny nose, watery eyes and congestion, making them think that they have allergies. However, they have never been tested to identify what allergen, if any, is the cause of the problem. Furthermore, there are other symptoms like chronic sinus infections, strep throat, asthma, eye infections, nasal polyps, chronic ear infections and migraine headaches that can also be caused by allergies. Common skin ailments like hives and eczema are treated as chronic illnesses when they could be allergy driven. If you are experiencing any of the above symptoms, talk to your doctor today to find out if **AllerFocus™** is right for you!

Is it covered by Insurance?

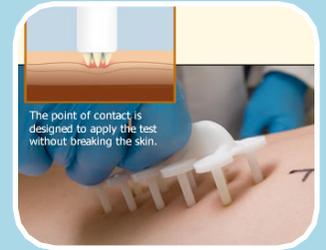

Yes, Allergy Testing and Allergy Shots are covered by most major medical plans.

How Does AllerFocus™ Work?

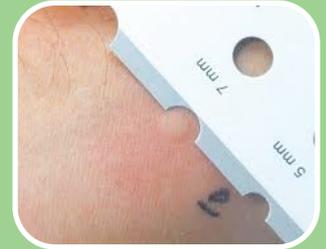

1 Testing:

AllerFocus™ is a **pain-free, needle free** skin scratch test that tests for 78 of the most common allergens.

2 Processing:

Allergens require about 15 to 20 minutes to form a reaction on the skin if a patient is allergic.

3 Analysis:

Results of the Allergy Test are available to your doctor in 20 minutes.

4 Personalization:

Based on your individual results you and your doctor can discuss various treatment options available including  Sublingual (Drops) or Subcutaneous (Shots) Immunotherapy.
